Positron Emission Tomography
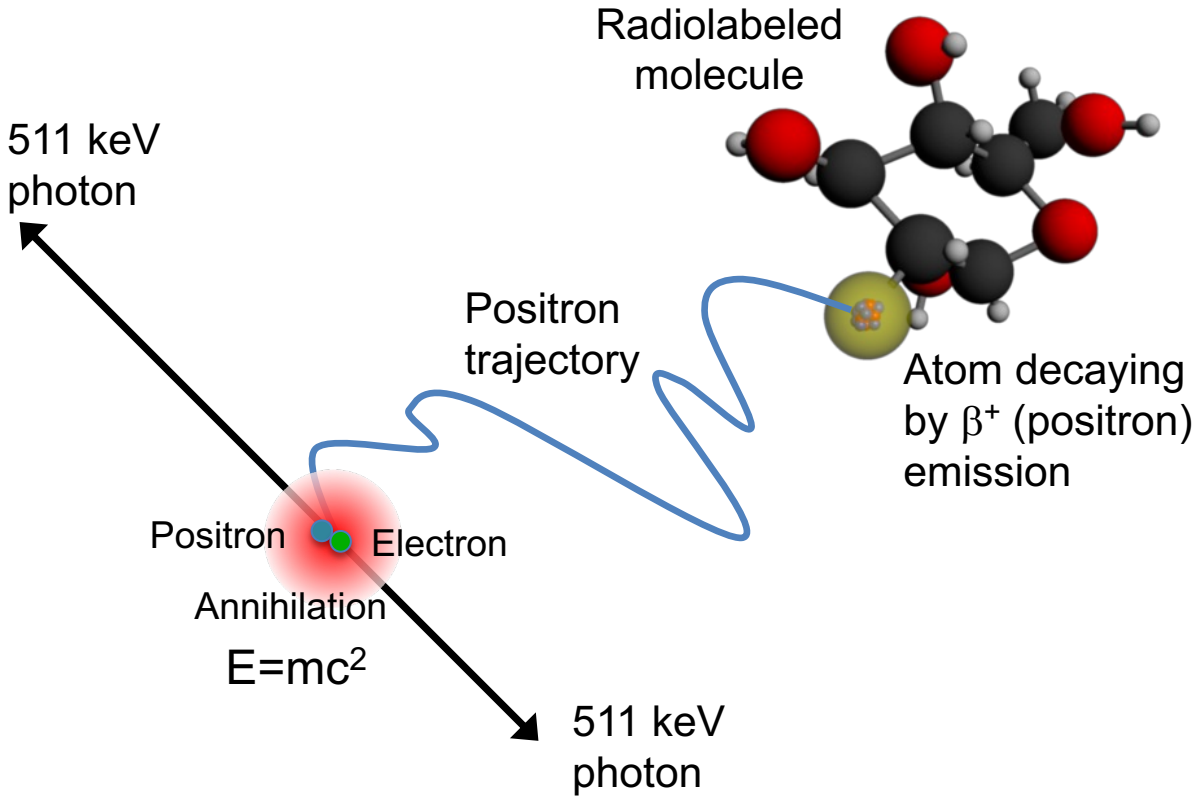
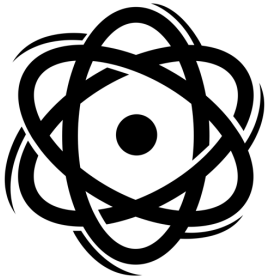
A Beautiful Piece of Physics



Positron-Emitting Radionuclides

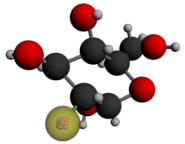


Isotope	Halflife	β^+ fraction	Max. Energy
C–11	**20.4 mins**	**0.99**	**0.96 MeV**
N–13	9.96 mins	1.00	1.20 MeV
O–15	123 secs	1.00	1.74 MeV
F–18	**110 mins**	**0.97**	**0.63 MeV**
Ga–68	**68.3 mins**	**0.88**	**1.90 MeV**
Rb–82	**78 secs**	**0.96**	**3.15 MeV**
Zr-89	**3.3 days**	**0.22**	**0.90 MeV**
I–124	4.18 days	0.22	3.16 MeV

and many others…

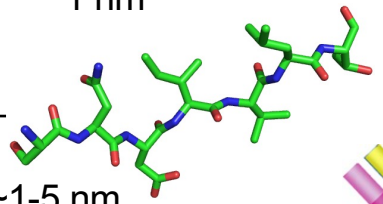
Radiolabeled Agents for PET Imaging

- **Small molecules**
  - Substrates for enzymes, receptor ligands, drugs…



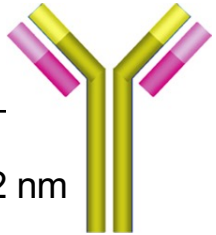
~1 nm

- **Peptides**
  - Receptor targeted, enzyme substrates…



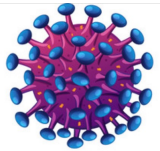
~1-5 nm

- **Antibodies**
  - Full length, minibodies, diabodies



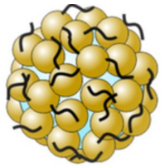
~10 x 2 nm

- **Pathogens**
  - Viruses, bacteria…



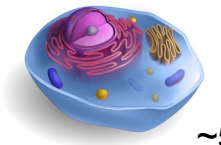
~20-200 nm

- **Particles**
  - Liposomes, lipospheres, nanoparticles…



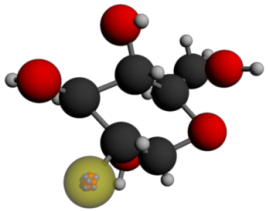
~20-100 nm

- **Cells**
  - T-cells, stem cells…



~5-100 µm

PET Radiotracers



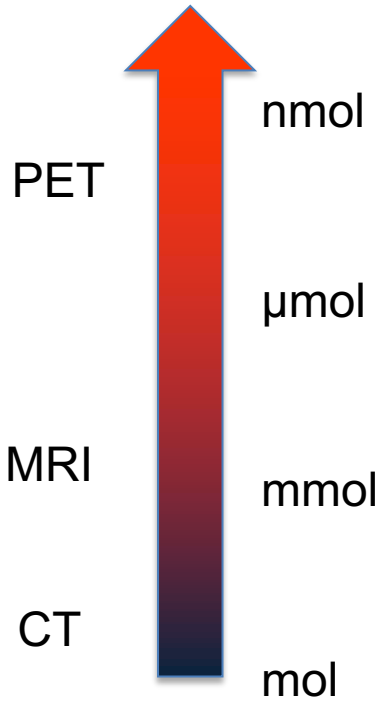
Physiology
Blood Flow $H_2{}^{15}O$, ^{11}C-butanol
Blood Volume ^{11}CO, ^{18}F-human serum albumin (HSA)

Metabolism
Oxygen $^{15}O_2$
Glucose ^{18}F-fluorodeoxygluose (FDG)
Fatty Acid ^{11}C-palmitate

Receptor/Protein Binding
Dopamine ^{11}C-raclopride
Prostate Specific Membrane Antigen (PSMA) e.g. ^{18}F-piflufolastat
CD8 (T-cells) e.g. ^{89}Zr-Df-Crefmirlimab
Beta-amyloid e.g. ^{18}F-florbetapir

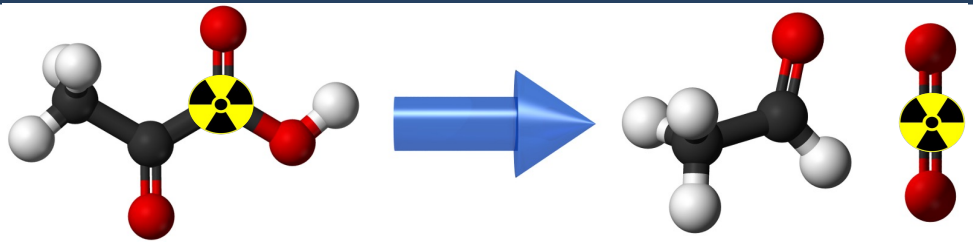
PET is Highly Sensitive

- PET radiotracers are synthesized with molar activity as high as 100-1000 GBq/μmol
- Typical administrations of small molecules are in the range 2.5 – 25 nmol (0.1 – 10 μg)
- PET is a **tracer** technique – generally no pharmacological effect
- Biodistribution may change with mass level – may want to add additional mass of cold compound



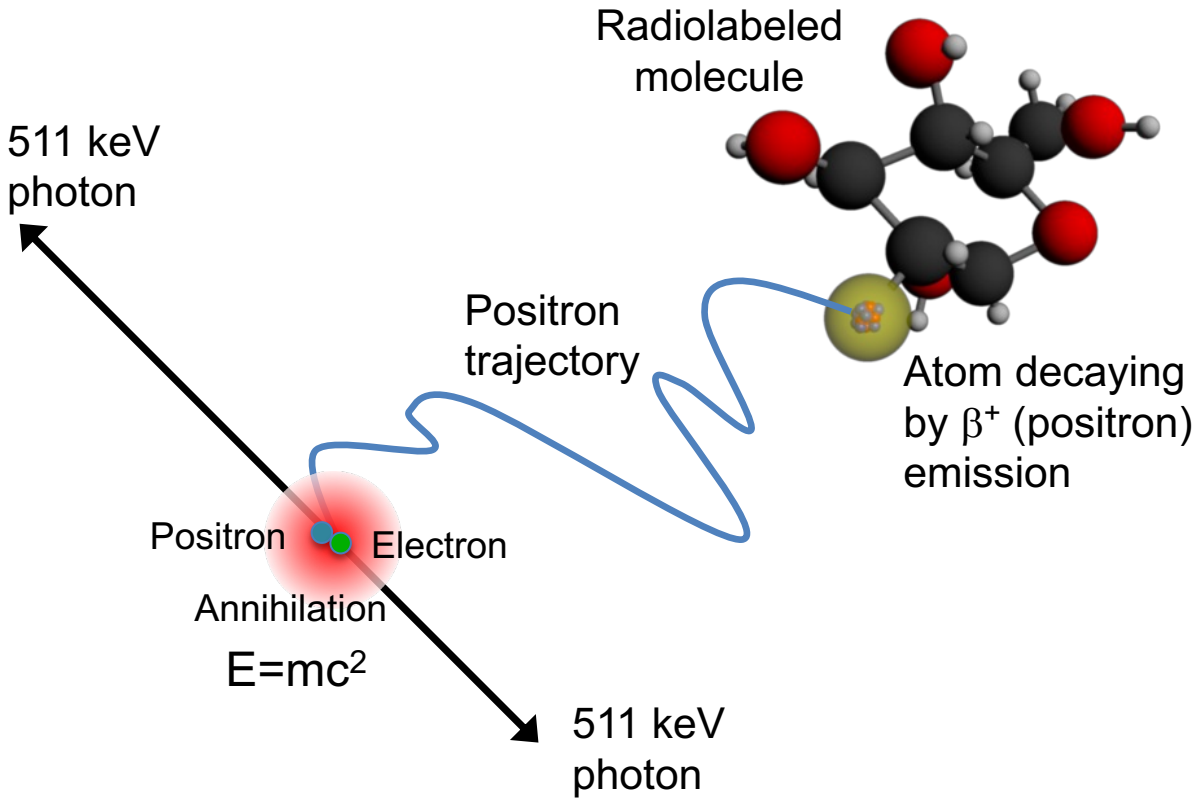
Luurtsema et al, *EJNMMI Radiopharmacy and Chemistry* 6; 34 (2021)

One Important Caveat – Metabolites!



- PET images the distribution of the **radioisotope**
- PET cannot distinguish radiolabeled metabolites from parent compound
- Important to know fate of radiotracer in the body over the imaging time
- Careful tracer design (native vs analog)
- May require metabolite correction/analysis to properly interpret images

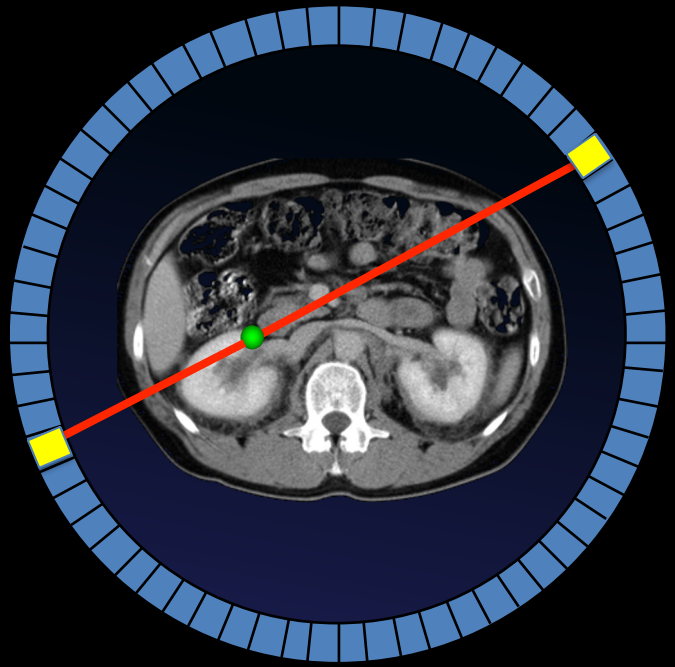
Positron Emission Tomography



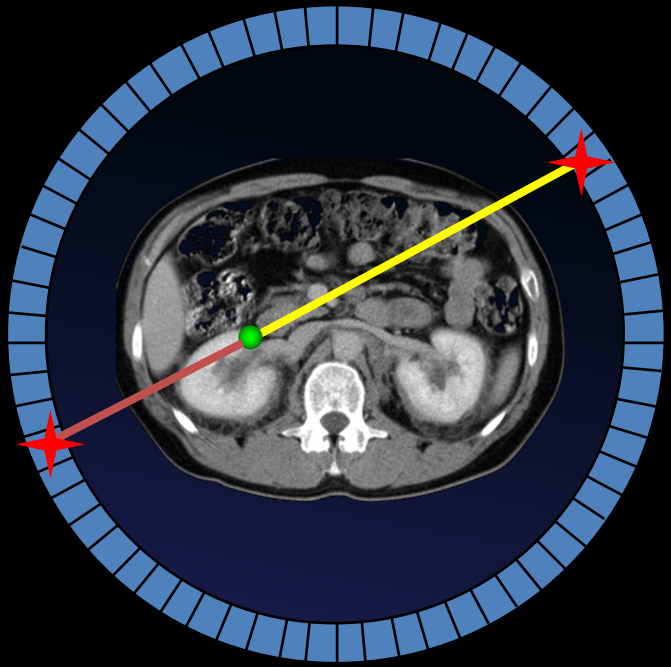
PET Scanner

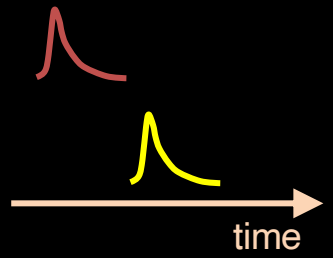
Rings of scintillation detectors

Very dense material to effectively absorb 511 keV photons

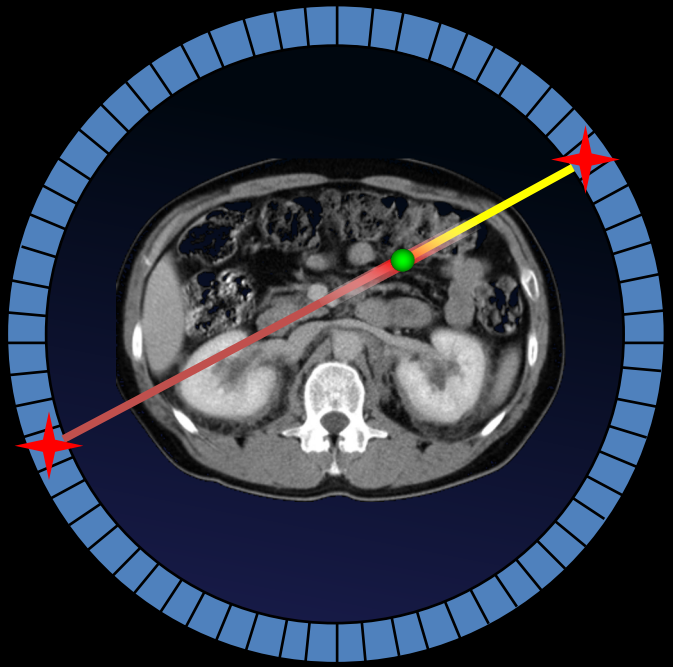


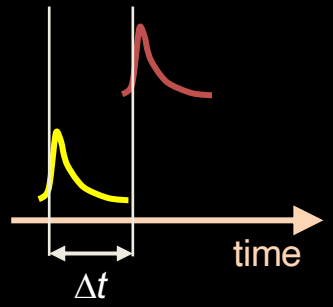
Time of Flight PET





Time of Flight PET





$$\Delta x = \frac{c\,\Delta t}{2}$$

Timing resolution

Δt = ~200 ps

Δx = 3 cm

Time of flight information not sufficient to directly localize events

Image Reconstruction

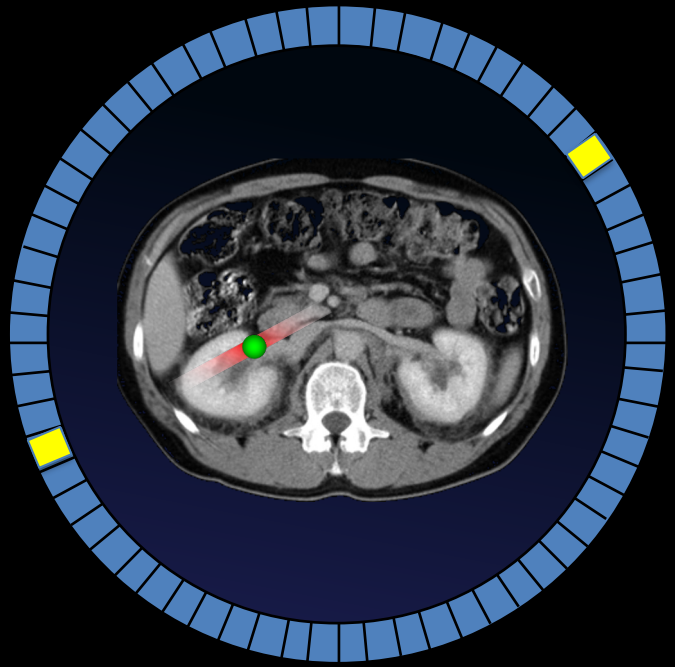
Sophisticated iterative methods

List mode time-of-flight

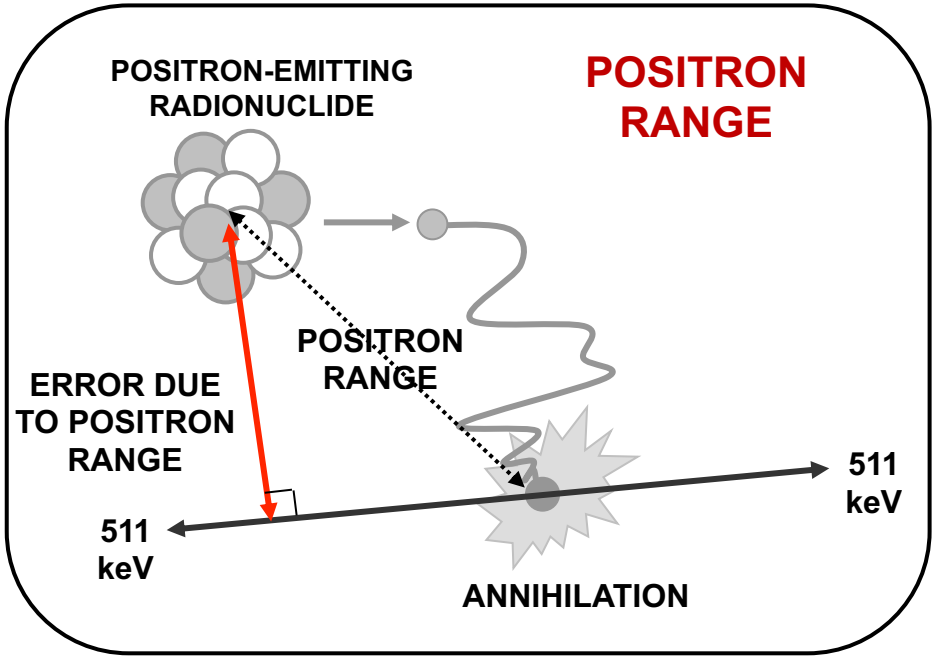
Ordered subsets, expectation maximization (OSEM)

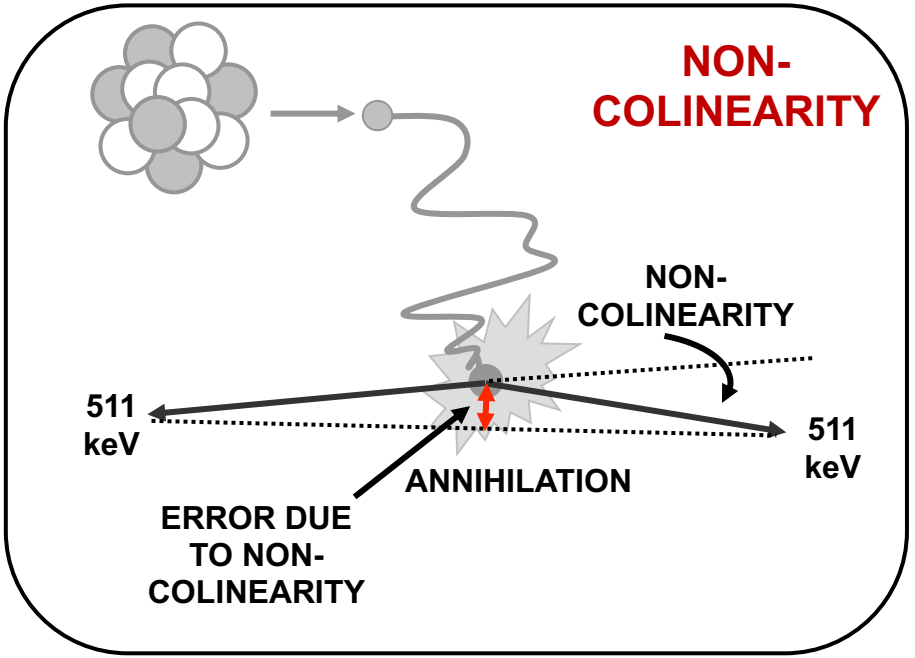
Point spread function (PSF) modeling may be applied

Post smoothing may be applied



The Spatial Resolution of PET is Limited





Whole-body imaging ~ 2 mm

Brain imaging ~ 1 mm

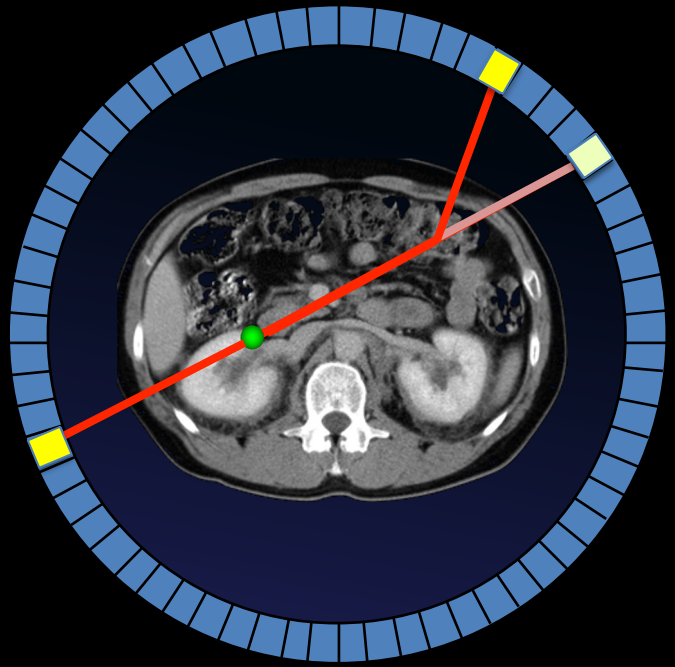
Data Corrections

Detector efficiency

Accidental (random) events

System deadtime

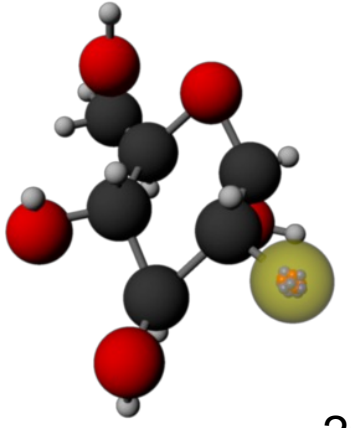
Photon attenuation and scatter
(using CT or MRI information)



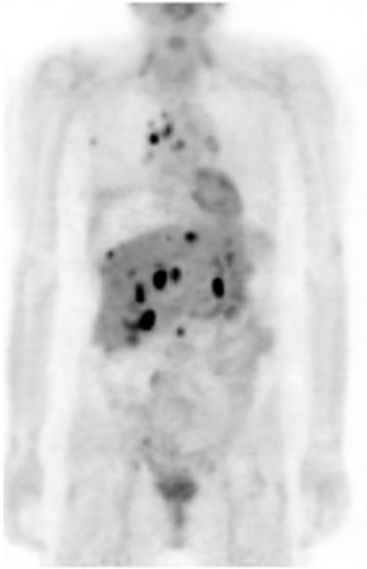
Clinical Use of PET Scanning

17 FDA approved PET tracers

[^{18}F]-fluoro-2-deoxy-D-glucose (FDG)



~20 mins

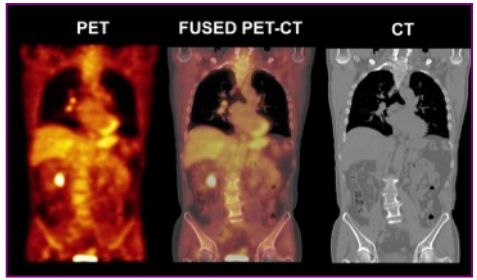


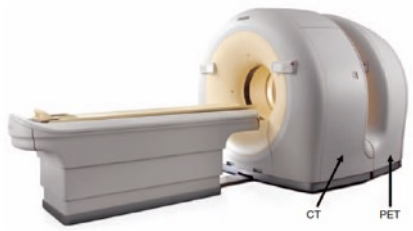
Clinical Use (2016 figures):

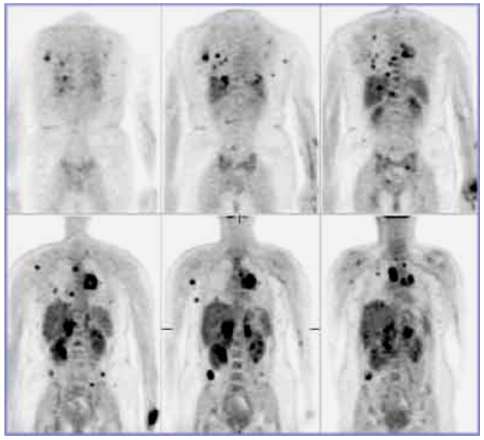
5.76 million scans per year at ~5,700 sites in the world

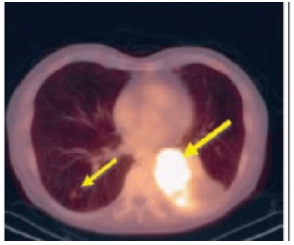
Oncology: staging, response to therapy
Cardiology: perfusion, viability
Neurology: amyloid imaging in AD

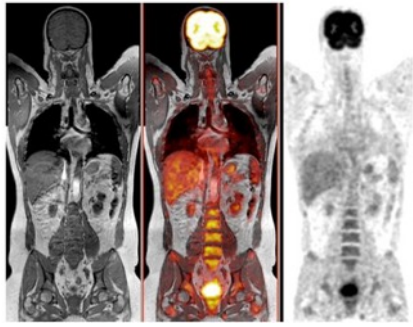
PET/CT and PET/MR Scanners

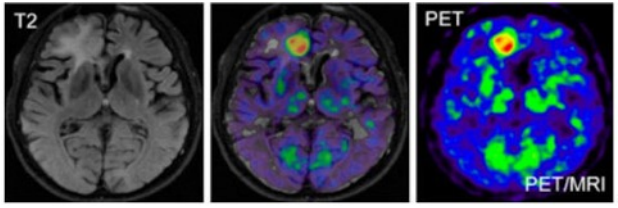


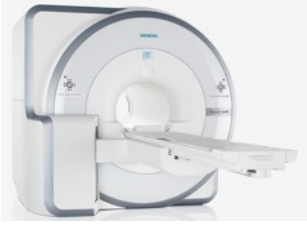






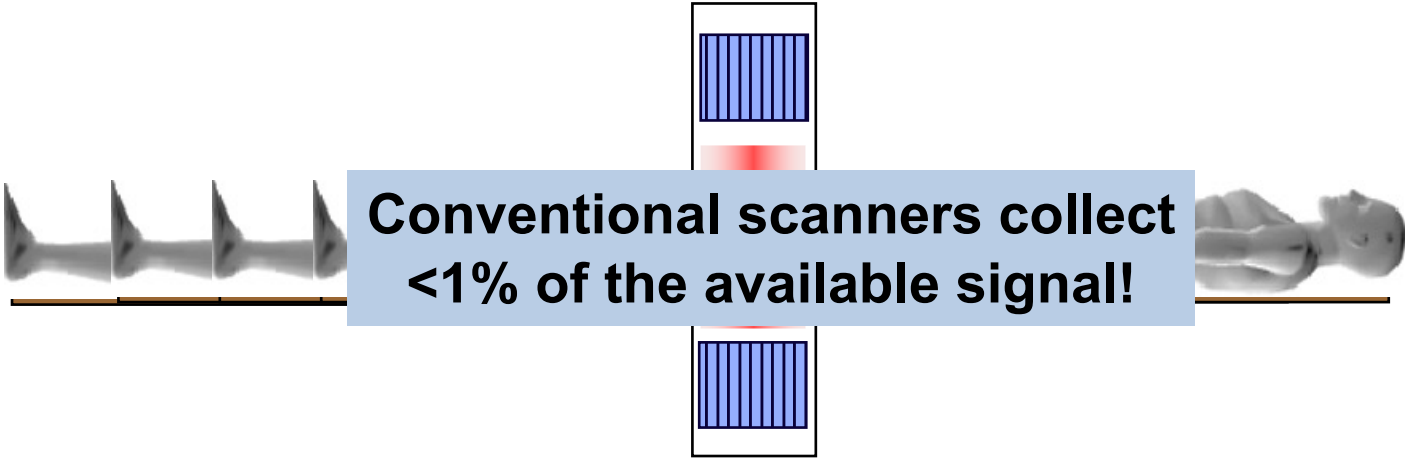






UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

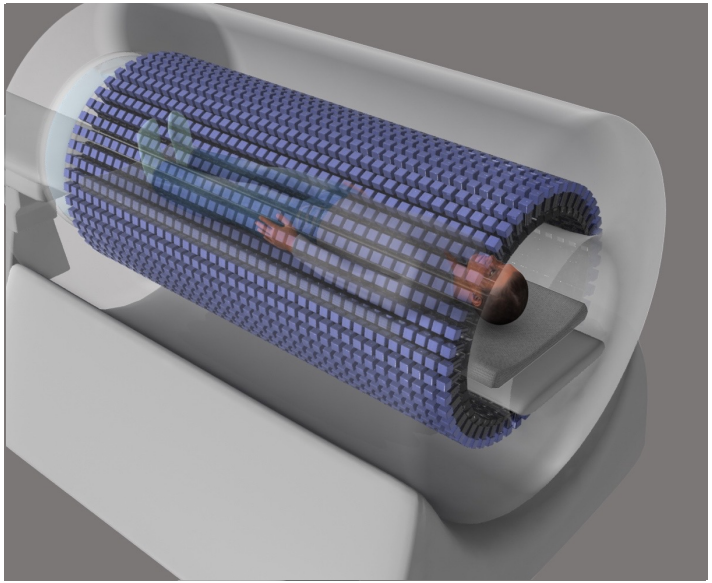
Signal Collection in PET



- PET provides the most sensitive non-invasive molecular assay of the human body
- All PET studies are limited by low signal, radiation dose, or both

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Total-Body PET



Total-Body PET/CT Scanner

Opportunities:

- All organs/tissues in field of view
- High geometric collection efficiency
- Leads to ~20-60 fold higher signal for whole-body imaging

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

uEXPLORER Scanner

UNITED IMAGING

Performance:

174 kcps/MBq sensitivity*
(<20 kcps/MBq industry standard)

2.9 mm spatial resolution*

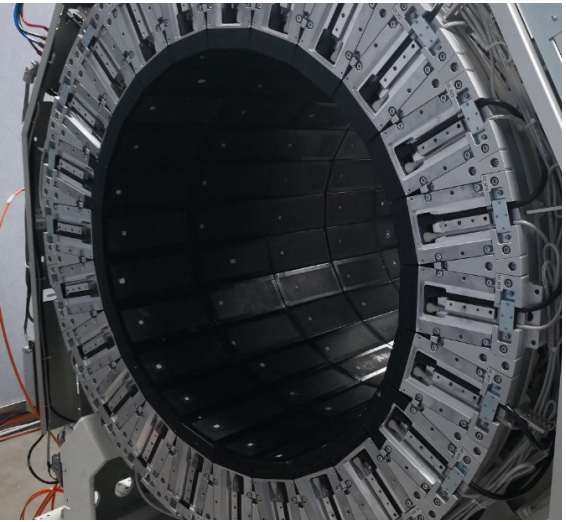
509 psecs time of flight

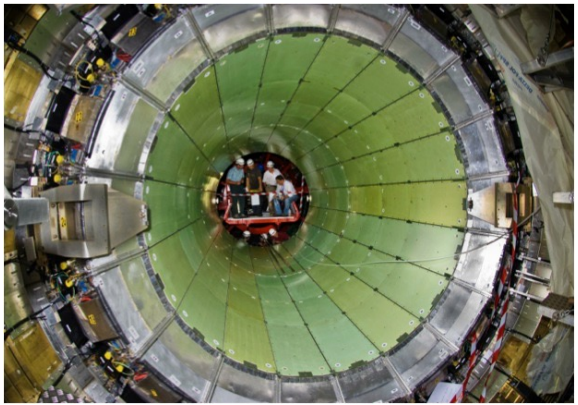
11.7% energy resolution

*NEMA NU 2-2018 protocol

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

EXPLORER vs CMS EM Calorimeter





# of crystals: 564,480
# of photodetectors: 53,760
# of electronic channels: 53,760
Mass: ~11,000 kg

# of crystals: 75,848
# of photodetectors: 137,048
# of electronic channels: 75,848
Mass: ~100,000 kg

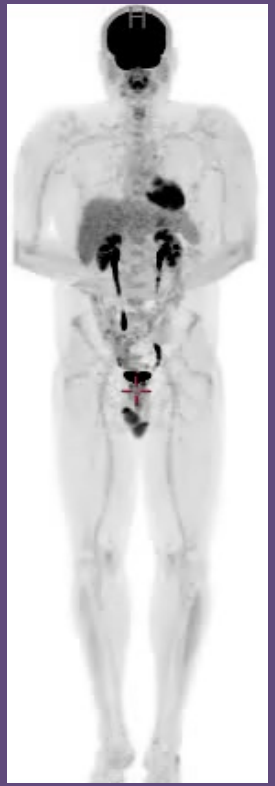
UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Capabilities of Total-Body PET

High quality imaging

Image quickly: 30 sec scan

Image gently: 18 MBq dose



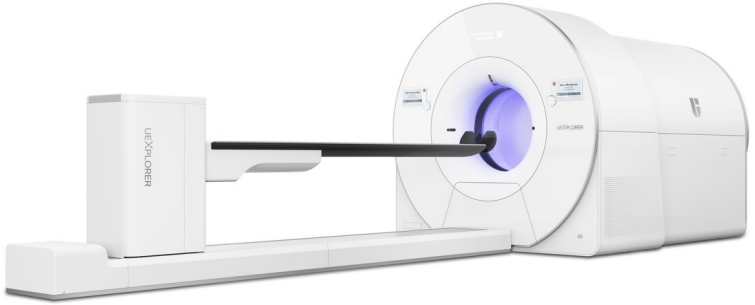
Total-Body and Long PET Scanners

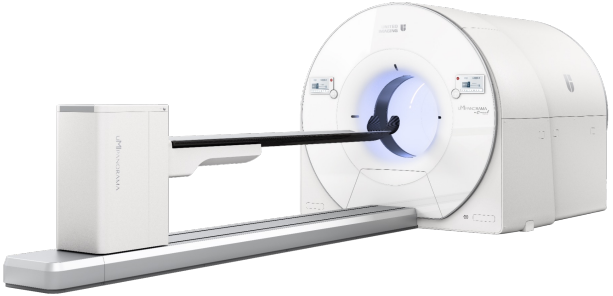
United Imaging uEXPLORER (194 cm)

~3 mm spatial resolution

total-body coverage

~500 ps time-of-flight





United Imaging Panorama GS (148 cm)

~200 ps time-of-flight

Siemens Vision Quadra (106 cm)

~220 ps time-of-flight

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

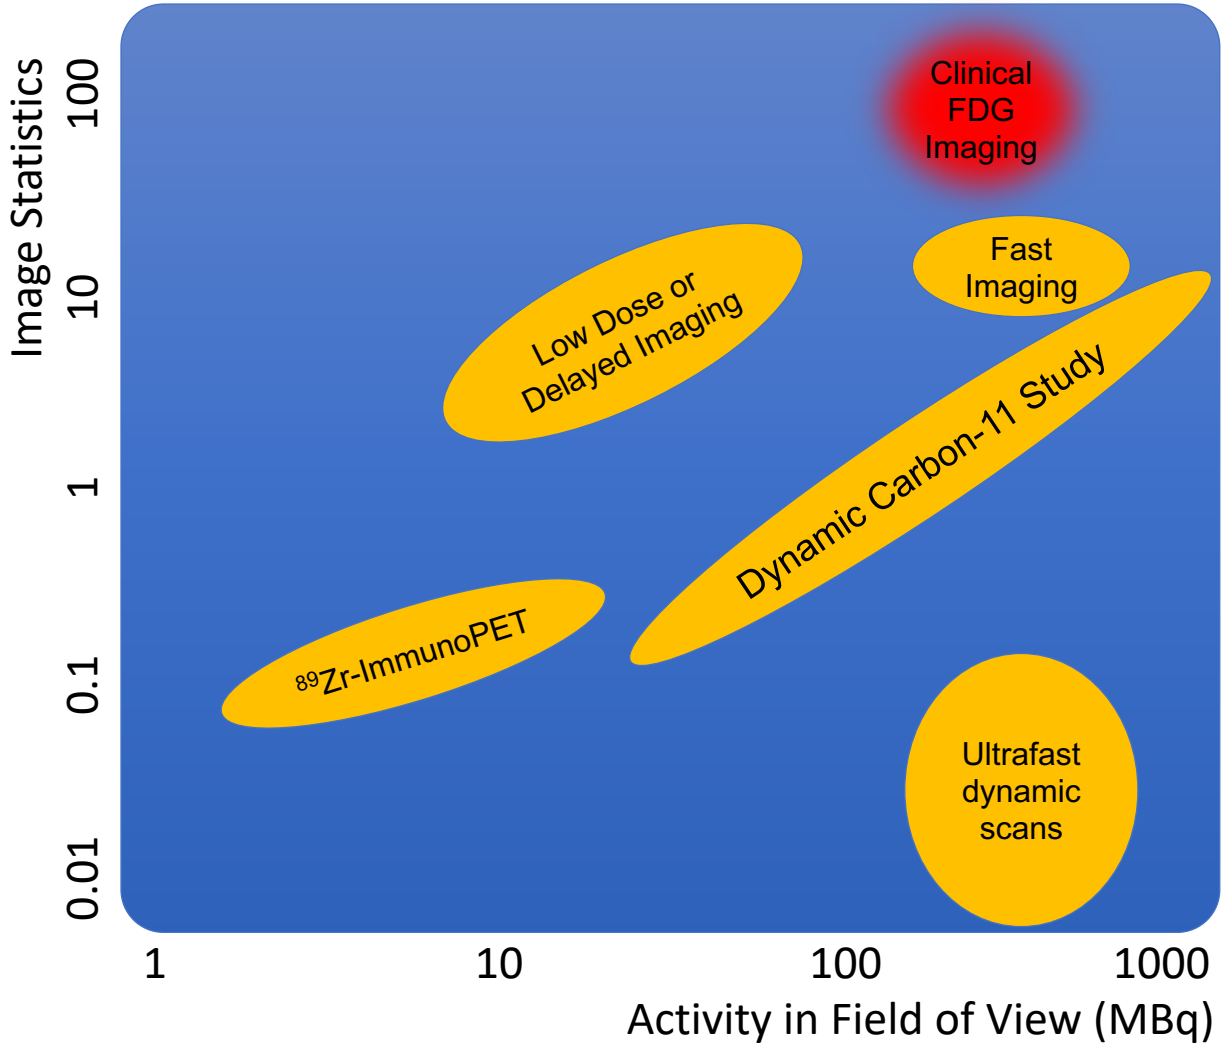
Challenge:

Need to be accurate and precise over 3-4 orders of magnitude!



UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Challenge:

Distribution varies over time and with different tracers

^{18}F-FDG

^{89}Zr-Df-Crefmirlimab

^{18}F-Florbetaben

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Challenge:

Subject volume can vary by > 10x

10 kg – 150 kg

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

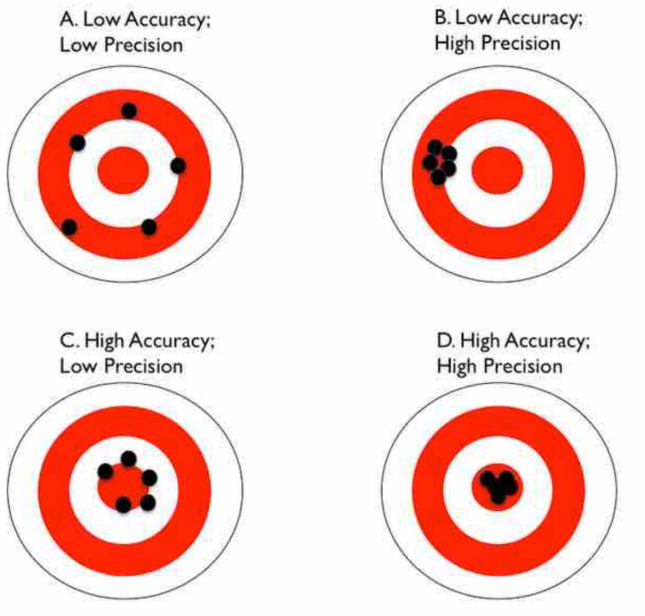
Quantitative Accuracy and Precision

- PET measures radiotracer concentration (kBq/cc)

- Precision (# of counts)
- Accuracy (data corrections)

- How good is it? ~ 5-10%
  - (ignoring biological variability)

- How good can it be?



UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Challenge:

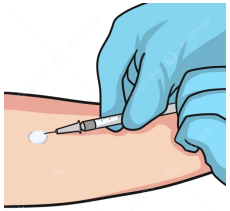
Motion occurs during scanning

Xuezhu Zhang, Eric Berg and Yasser Abdelhafez

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Static vs Dynamic Imaging

Static imaging



inject

wait

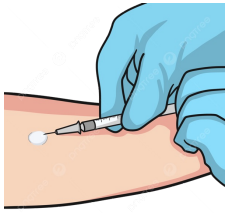
scan

image

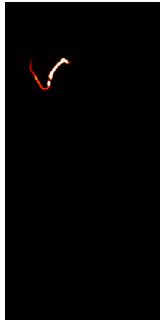
- Simple
- Short time in scanner

Dynamic imaging

+



position subject in scanner, imaging starts just before injection



time series of images

- More time in scanner
- More information

UCDAVIS

EXPLORER MOLECULAR IMAGING CENTER

Metrics from Static Scans

- **Standardized Uptake Value (SUV)**

$$\text{SUV (g/ml)} = \frac{C_{tissue}(\text{kBq/ml})}{A(\text{kBq}) / w(\text{g})}$$

Sensitive to uptake time, tracer delivery, scanner/dose calibrator calibration etc.
10-15% variability in within-subject test-retest studies

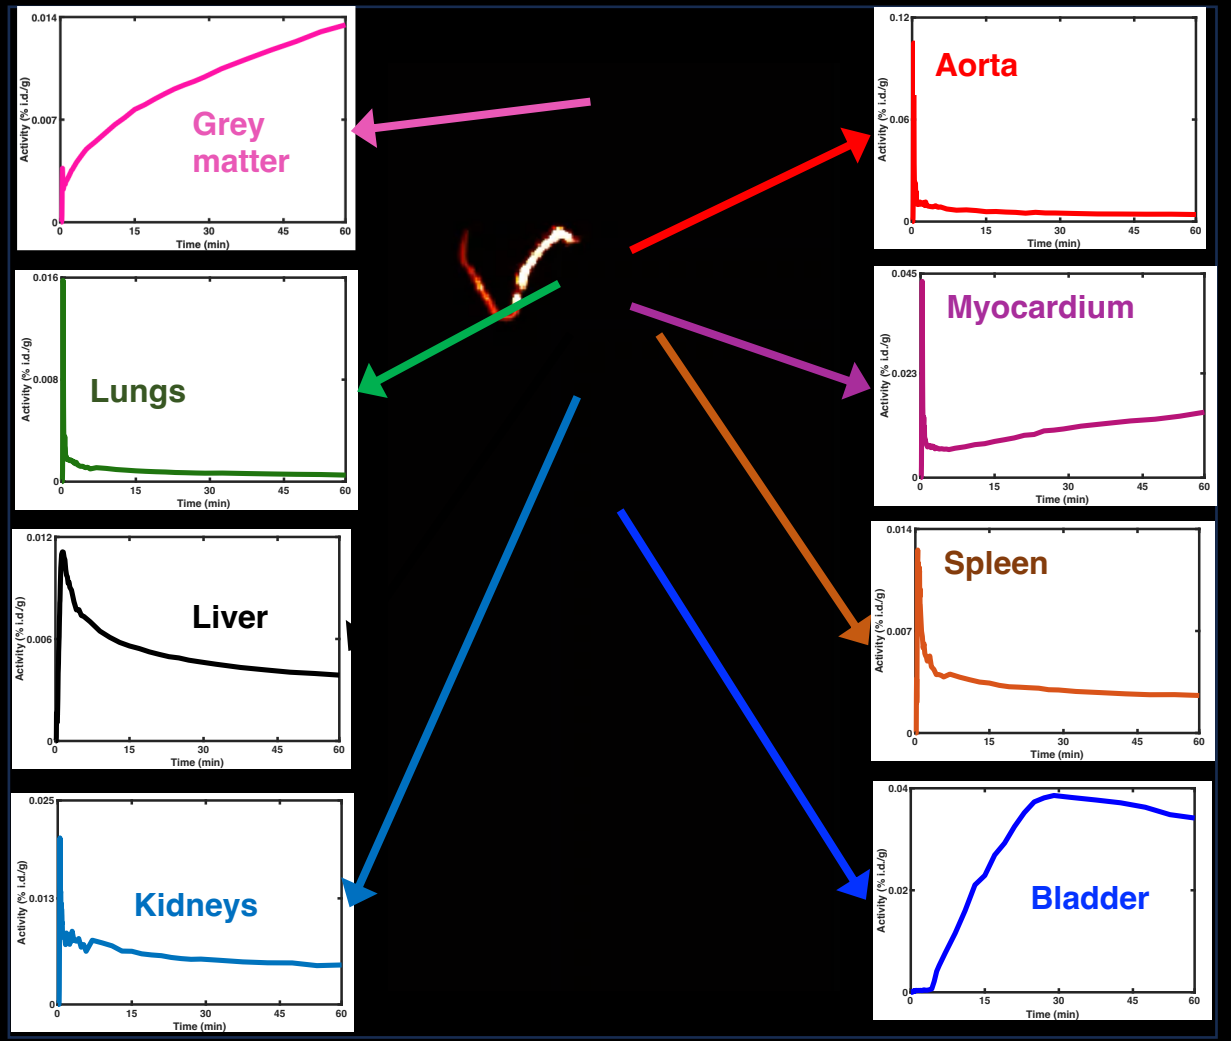
- **Standardized Uptake Value Ratio (SUVR)**

$$SUVR = SUV_{tissue}/SUV_{reference}$$

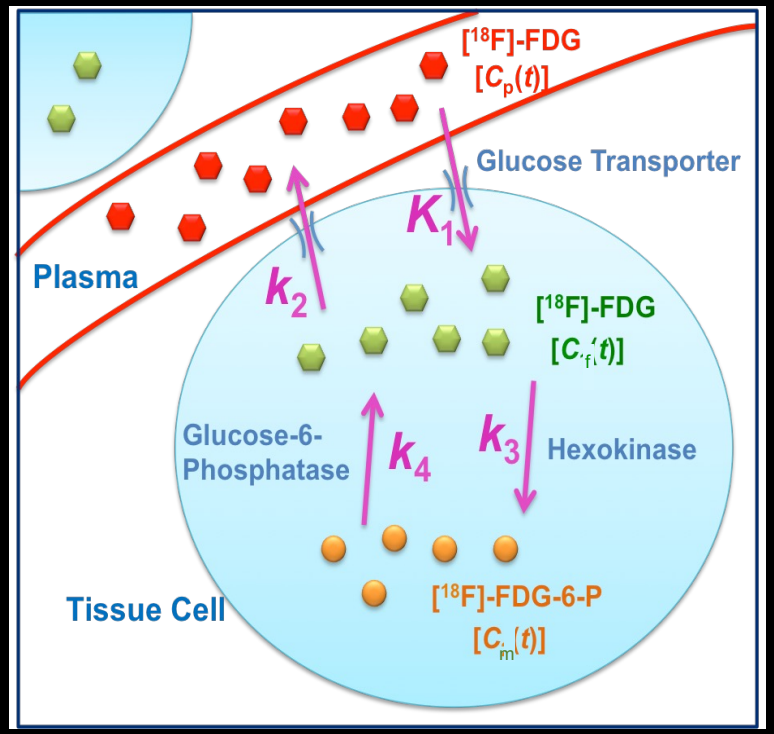
Boellaard, J Nucl Med 2009;50:115–120

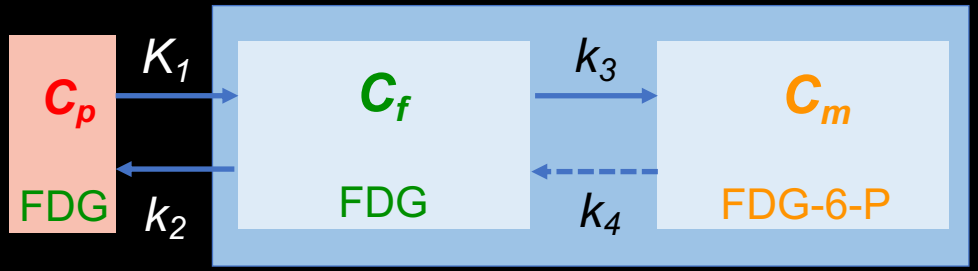
Total-Body Dynamic Imaging

Time-activity curves (TACs)



Total-Body Kinetic Modeling





$$\frac{dC_f}{dt} = K_1 C_p - (k_2 + k_3) C_f + k_4 C_m$$

$$\frac{dC_m}{dt} = k_3 C_f - k_4 C_m$$

$$C_{PET}(t) = (1 - v_b)(C_f(t) + C_m(t)) + v_b C_p(t)$$

Guobao Wang, UC Davis

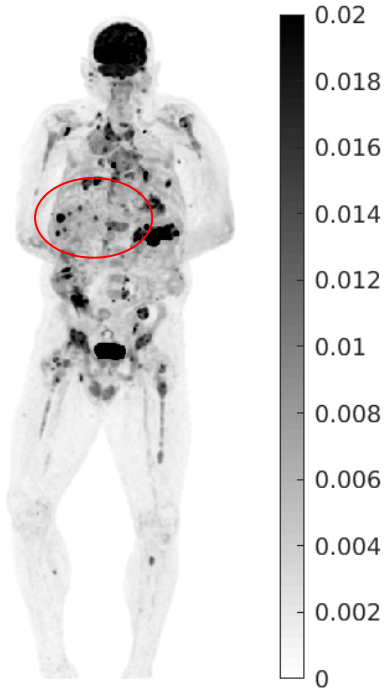
EXPLORER MOLECULAR IMAGING CENTER

Parametric Imaging with ^{18}F-FDG

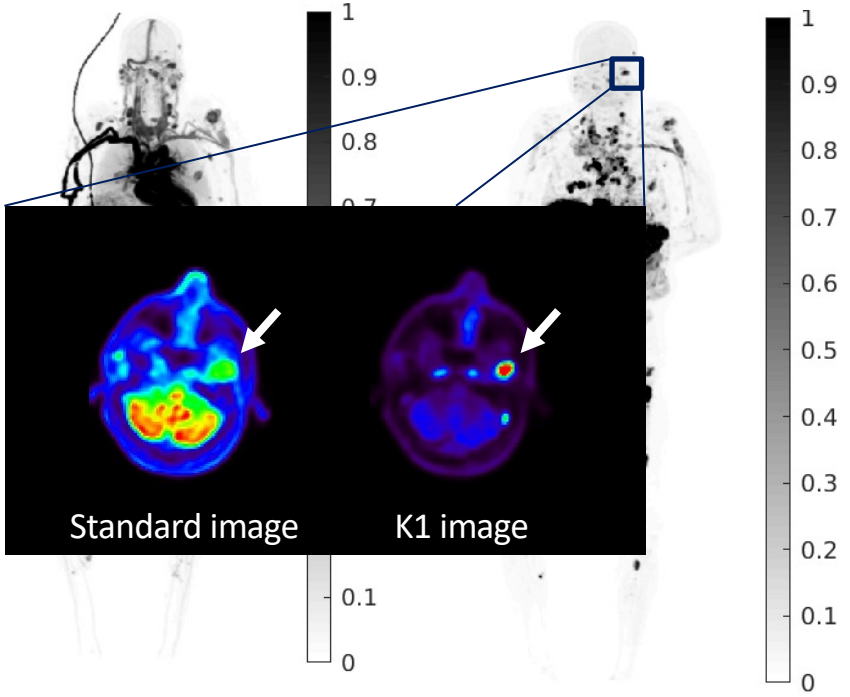
SUV (g/ml)

K_i: Overall FDG influx rate (ml/g/min)



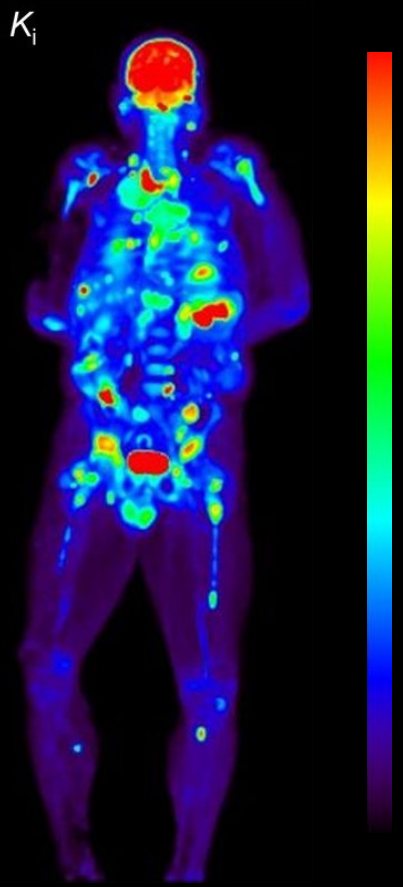
v_b: fractional blood volume

K_1: glucose transport rate (ml/g/min)



Courtesy of Dr. Guobao Wang, UC Davis

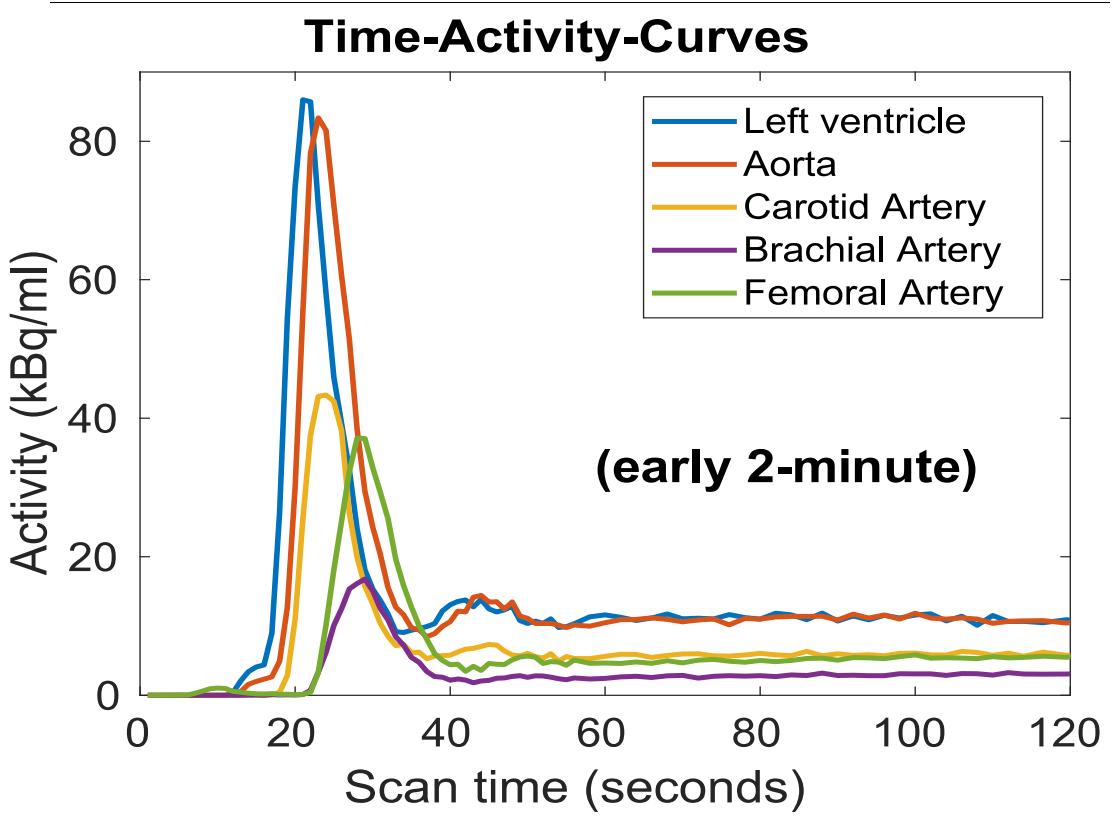
Challenges and Limitations in Kinetic Modeling



- Delay and dispersion of the blood input function
- Input function measures C_{wb} not C_p
- Model selection and special cases
  - Blood, liver, lungs etc…
- Correcting for metabolites
- Selecting appropriate model complexity
  - What can the data support?
  - Identifiability analysis
- Effects of motion

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Image-Derived Input Function



Input function shows both **delay** and **dispersion** with distance from the left ventricle

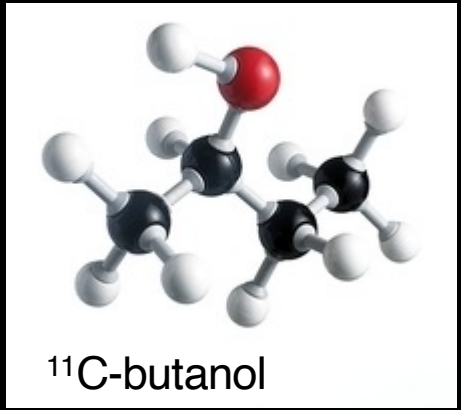
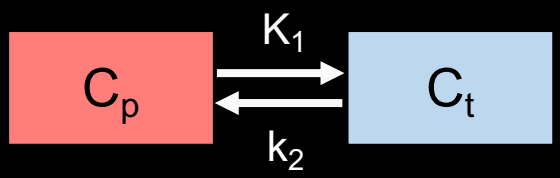
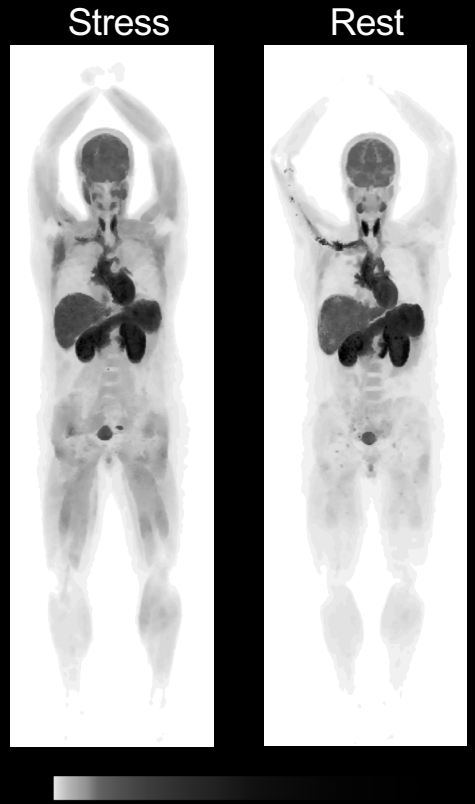
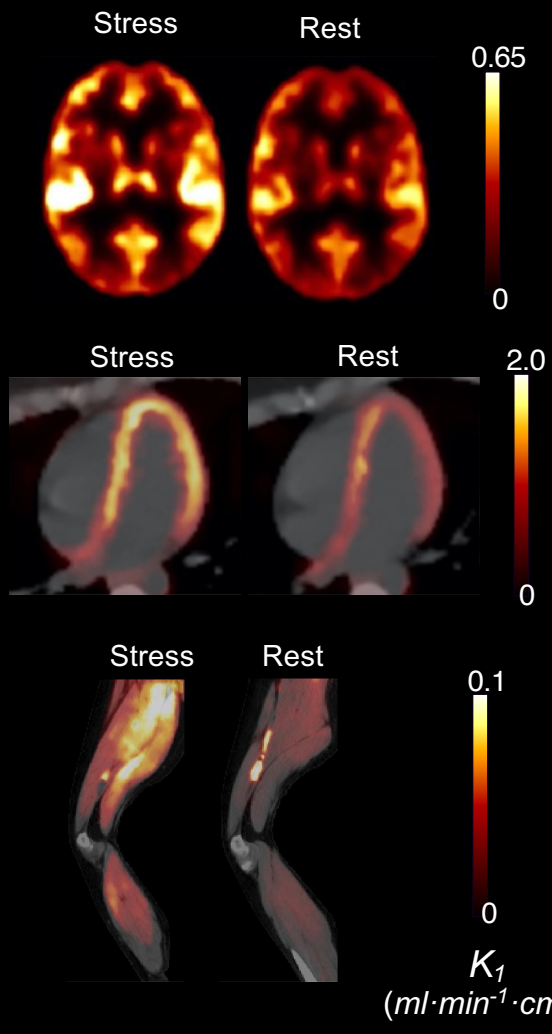
Total-Body Perfusion Imaging



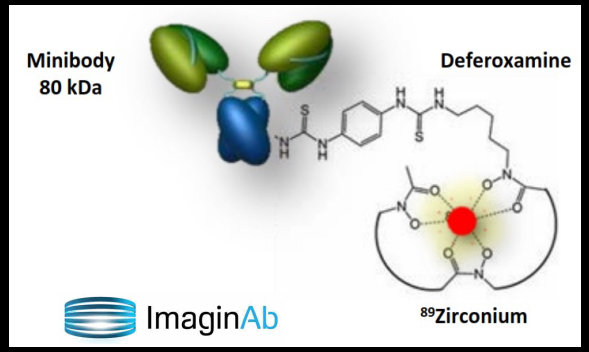






Elizabeth Li, UC Davis/UPenn

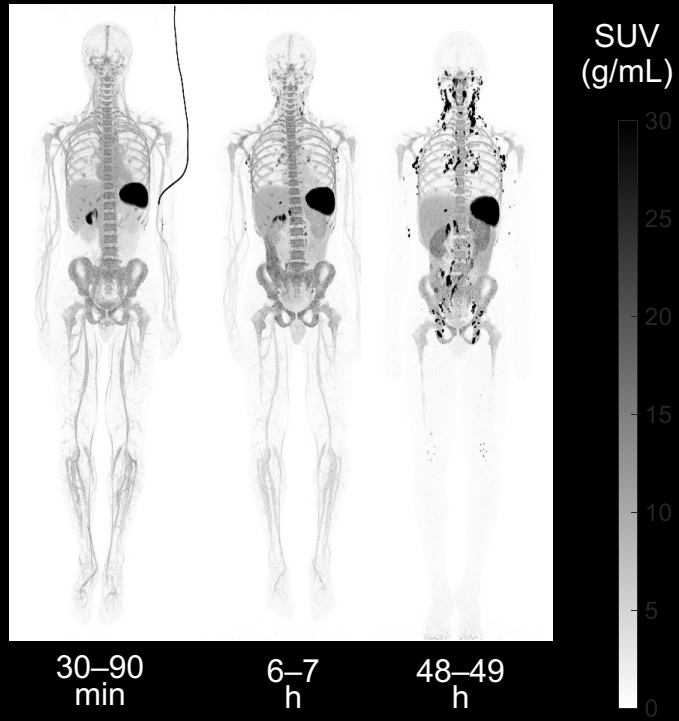
Targeted Imaging of CD8+ T cells

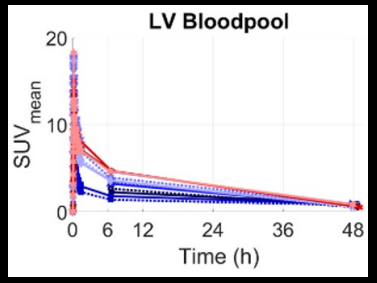


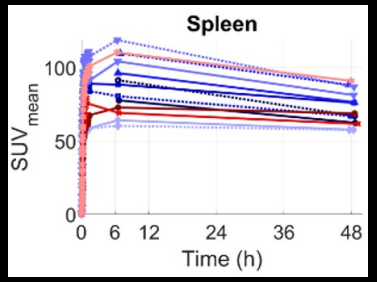
Crefmirlimab is a minibody with high affinity to **human CD8**

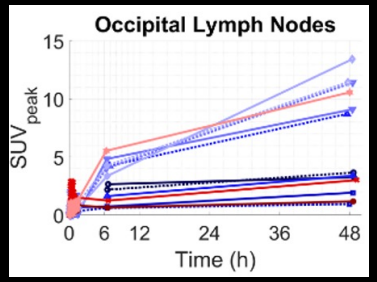
0.5 mCi (18 MBq) of
^{89}Zr-Df-Crefmirlimab-Berdoxam

Control
M, 25 y/o, BMI 21









New models needed!

Negar Omidvari, UC Davis

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Considerations in Study Design

- Radiotracer selection
- **Subject selection**
- Imaging protocol (static/dynamic)
- Reconstruction protocol
- Analysis methods

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Function is Highly Variable

- Brain anatomy[1]
  - Grey matter volume
  - Between-subject variability: 8.9%

- Brain function[2]
  - Cerebral perfusion
  - Between-subject variability: 16.2%
  - Within-subject variability: 4.8%

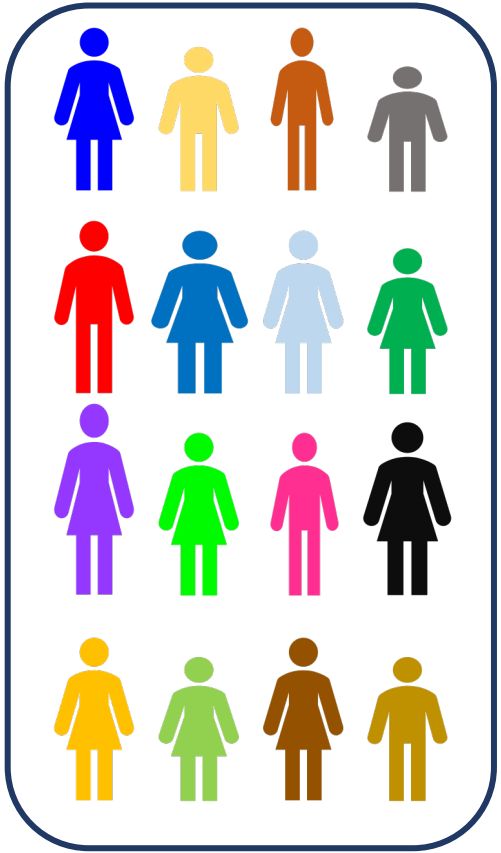
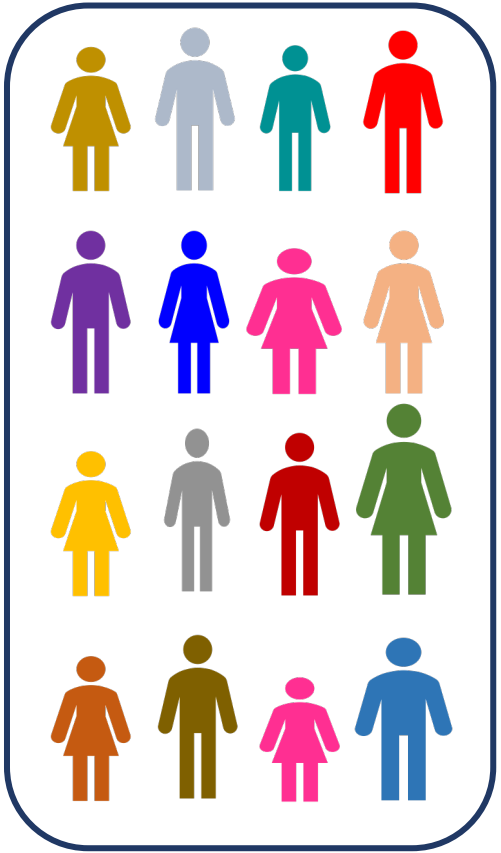
Across-subject Design



Control Group



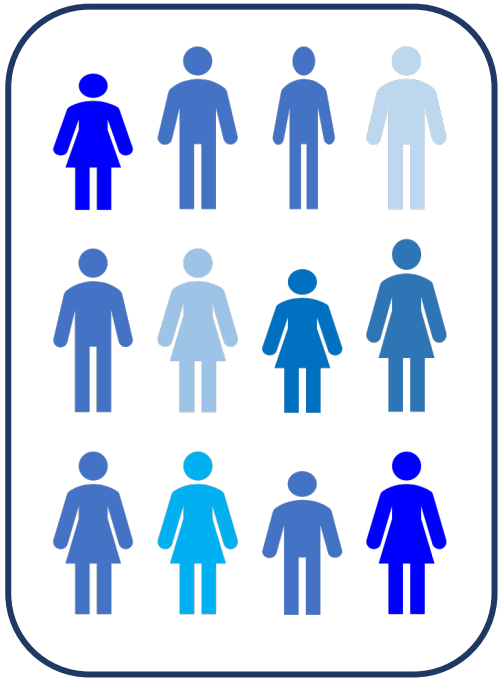
Disease Group

Requires large numbers of subjects

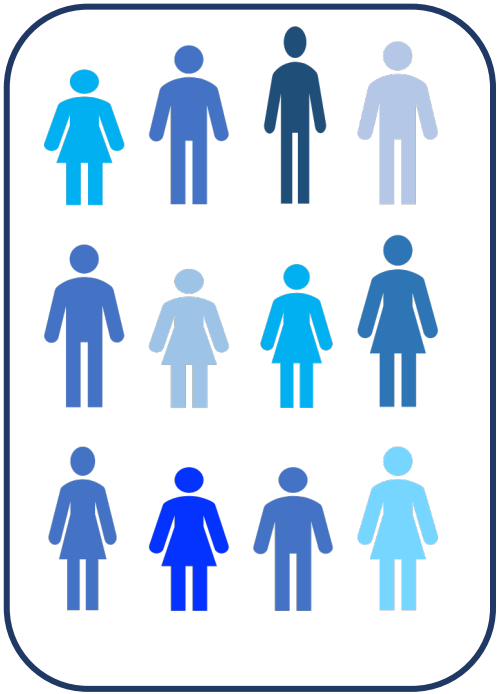
UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Matched Across-subject Design

gender, age, BMI, ethnicity, etc…



Control Group

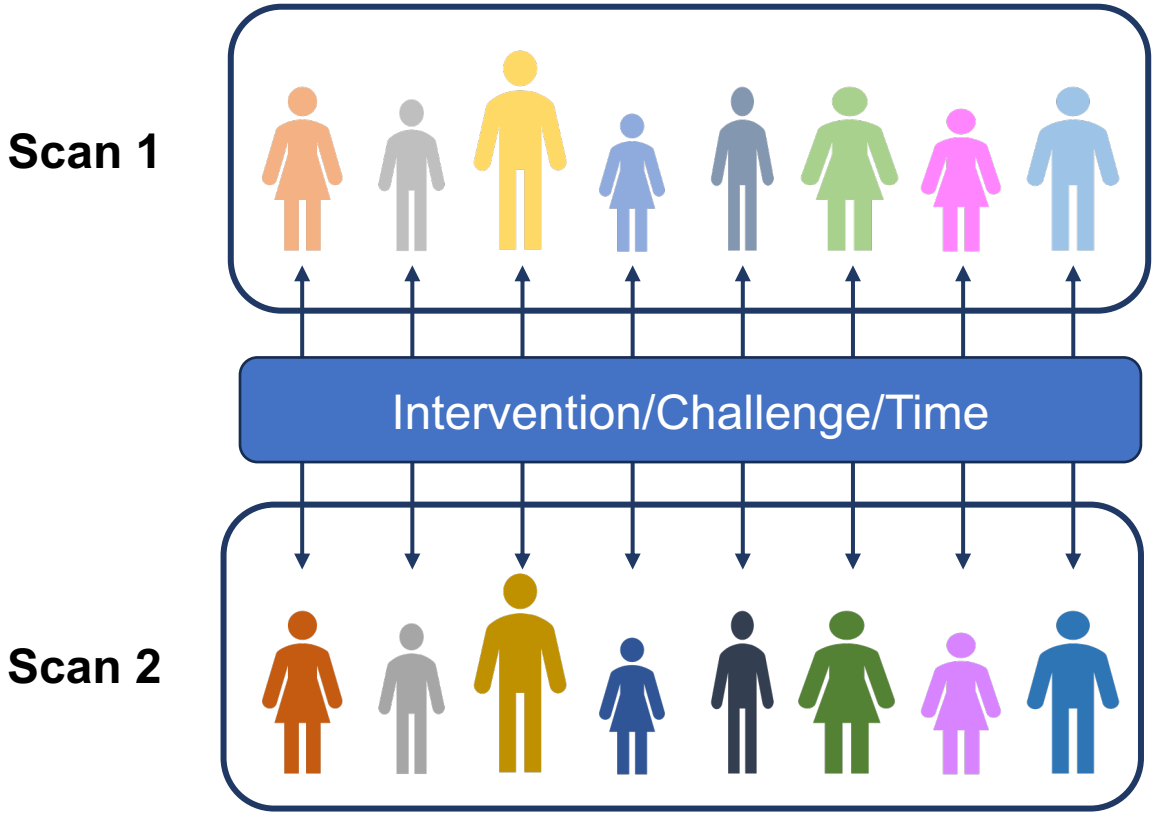


Disease Group

Reduce number of subjects
Cohorts may be less diverse and representative

UCDAVIS
EXPLORER MOLECULAR IMAGING CENTER

Within-subject Design



Each subject serves as their own control

UC DAVIS
EXPLORER MOLECULAR IMAGING CENTER

Summary

- PET is a highly sensitive technique that can quantitatively measure physiology, metabolism and molecular targets.
- Advanced total-body PET scanners enable radiotracer pharmacokinetics to be measured in the entire human body with good signal-to-noise ratio.
- Total-body PET offers new opportunities for studying the human body as a system in health and disease
